Preface	xiii
1 The Cardiovascular System under an Ergometric Workload	1
1.1 Some Physiological Facts	1
1.2 The Basic Model	6
1.3 Analysis of the Basic Model	16
1.3.1 Existence of equilibria	16
1.3.2 An invariance property of Grodins' system	21
1.4 The Linear-quadratic Regulator Problem	22
1.5 The Bicycle Ergometer Test	25
1.6 Parameter Identification	27
1.6.1 A priori determined parameters	28
1.6.2 The output-least-squares formulation of the parameter identification problem	30
1.7 Numerical Results	33
1.7.1 Parameter identification	33
1.7.2 Gradient computations	35
1.7.3 Sensitivity analysis	36
2 Respiratory Modeling	45
2.1 Respiratory Control Physiology	46
2.1.1 General features of respiration	46
2.1.2 The chemical control system for ventilation	48
2.1.3 Structural features of ventilation	52
2.1.4 Blood gas transport	53
2.1.5 Respiratory control stresses and problems	57
2.1.6 Approaches to modeling respiratory control	58
2.2 Respiratory Control Model	59
2.2.1 The lung compartment	60
2.2.2 The tissue compartment	62
2.2.3 The brain compartment	62
2.2.4 Dissociation relations	63
2.2.5 State delays	63
2.2.6 Empirical control equation	64

2.2.7	Minute ventilation and tidal volume	65
2.2.8	Cardiac output and cerebral blood flow	66
2.3	Stability of Respiratory Control	66
2.3.1	Computation of the delays	66
2.3.2	Stability and delays	68
2.4	Modeling Applications	78
2.4.1	Sleep and periodic breathing	79
2.4.2	Periodic breathing and high altitude	83
2.4.3	Respiratory complications of heart failure	89
2.4.4	Other modeling issues	94
3	Cardio-Respiratory Modeling	103
3.1	Physiology Introduction	103
3.1.1	Global control of the cardiovascular system	104
	The baroreflex and neural short-term control	105
	Hormonal short-term control	110
	Renal control and long-term control	111
3.1.2	Local control of the cardiovascular system and autoregulation	112
	Control of metabolic demand	113
	Autoregulation	113
	Autoregulation and local control of special organs	114
3.1.3	Blood volume shift	116
3.1.4	Interaction of CVS and RS control	117
3.2	The Combined Model	123
3.2.1	Model equations	124
3.2.2	State dependency of the delays	126
3.2.3	Control formulation	127
3.2.4	Steady state relations	128
3.3	Modeling applications	133
3.3.1	Congestive heart failure	133
3.3.2	Orthostatic and LBNP stress	138
3.3.3	Blood volume control and hemorrhage	146
3.3.4	Cerebral blood flow and orthostatic intolerance	152
4	Blood Volume and the Venous System	161
4.1	Introduction	161
4.2	Scaling	162
4.2.1	Isometric relationships	162
4.2.2	Allometric relationships	163
4.2.3	Cardiovascular entities	164
4.3	The Venous System	165
4.4	Capacitance	167
4.4.1	Passive mechanisms	167
	Capacitance	168
	Compliance	168

	Unstressed volume	168
	Stressed volume	168
	Specific entities	169
4.4.2	Active mechanisms	169
4.4.3	Flow effects	170
4.4.4	Modeling and measurement	172
4.4.5	System of compliances	173
4.4.6	Mean circulatory filling pressure	174
4.4.7	Parallel arrangement	176
4.5	Blood Volume	177
4.5.1	Characteristic times	177
4.5.2	Red blood cells	178
4.5.3	Plasma	179
4.5.4	Microvascular filtration	179
4.5.5	Volume regulation	179
	Defense against volume loss	179
	Defense against volume excess	180
	Pressure natriuresis revisited	180
4.5.6	Volume measurement	183
4.5.7	Red blood cell distribution	184
4.5.8	Hemoconcentration	185
4.6	Hemodialysis	186
4.6.1	Ultrafiltration	187
4.6.2	Vascular refilling	187
	Passive vascular refilling	188
	Active vascular refilling	189
	Blood pressure control	190
4.6.3	Ultrafiltration control	191
	Blood volume tracking	193
	Critical hemoconcentration	193
4.6.4	Blood pressure control	193
4.6.5	Time variant system	194
4.6.6	Ultrafiltration pulses	194
4.6.7	Blood volume sequestration	195
4.6.8	Blood volume sensitivity	195
5	Future Directions	199
5.1	Introduction	199
5.2	Physiological Questions	200
5.3	Mathematical and Modeling Issues	204
5.4	Clinical Applications	206
A	Supplemental Calculations	211
A.1	Equilibrium Computation for the Cardiovascular System if P_{as} is Given	211
A.2	The Jacobian of $\mathcal{F}(x, p, W, 0)$ with Respect to x	212
A.3	Sensitivity with Respect to a Variable	214

A.4	Generalized Sensitivity Functions	214
B	A Nonlinear Feedback Law	221
B.1	The Relative Degree of a System	221
B.2	A Nonlinear Coordinate Transform	222
B.3	Construction of the Feedback Law	225
B.4	The Nonlinear Feedback Law for the Cardiovascular Model	225
C	Retarded Functional Differential Equations: Basic Theory	229
C.1	Basic Notions	229
C.2	Linear Equations and the Linear-quadratic Regulator Problem	232
C.3	Eigenvalues and local stability	235
	Bibliography	239
	Index	263
