Preface	ix
Introduction	xi
Veit Elser	
Three Lectures on Statistical Mechanics	1
Lecture 1. Mechanical foundations	3
Lecture 2. Temperature and entropy	15
Lecture 3. Macroscopic order	25
Bibliography	41
Henry Cohn	
Packing, Coding, and Ground States	43
Preface	45
Lecture 1. Sphere packing	47
1. Introduction	47
2. Motivation	48
3. Phenomena	50
4. Constructions	52
5. Difficulty of sphere packing	54
6. Finding dense packings	55
7. Computational problems	57
Lecture 2. Symmetry and ground states	59
1. Introduction	59
2. Potential energy minimization	60
3. Families and universal optimality	61
4. Optimality of simplices	65
Lecture 3. Interlude: Spherical harmonics	69
1. Fourier series	69
2. Fourier series on a torus	71
3. Spherical harmonics	73
Lecture 4. Energy and packing bounds on spheres	77
1. Introduction	77
2. Linear programming bounds	79
3. Applying linear programming bounds	81

4. Spherical codes and the kissing problem	82
5. Ultraspherical polynomials	83
Lecture 5. Packing bounds in Euclidean space	89
1. Introduction	89
2. Poisson summation	91
3. Linear programming bounds	92
4. Optimization and conjectures	94
Bibliography	99
Alpha A. Lee and Daan Frenkel	
Entropy, Probability and Packing	103
Introduction	105
Lecture 1. Introduction to thermodynamics and statistical physics	107
1. Classical equilibrium thermodynamics	107
2. Statistical physics of entropy	113
3. From entropy to thermodynamic ensembles	119
4. Exercises	123
Lecture 2. Thermodynamics of phase transitions	125
1. Thermodynamics of phase equilibrium	125
2. Thermodynamic integration	126
3. The chemical potential and Widom particle insertion	130
4. Exercises	133
Lecture 3. Order from disorder: Entropic phase transitions	135
1. Hard-sphere freezing	136
2. Role of geometry: The isotropic-nematic transition	140
3. Depletion interaction and the entropy of the medium	145
4. Attractive forces and the liquid phase	151
5. Exercises	154
Lecture 4. Granular entropy	157
1. Computing the entropy	158
2. Is this “entropy” physical?	160
3. The Gibbs paradox	161
Bibliography	165
Michael P. Brenner	
Ideas about Self Assembly	167
Introduction	169
Lecture 1. Self assembly: Introduction	171
1. What is self-assembly	171
2. Statistical mechanical preliminaries	172

Lecture 2. Self assembly with identical components	175
1. Introduction	175
2. The (homogeneous) polymer problem	176
3. Cluster statistical mechanics	179
Lecture 3. Heterogeneous self assembly	187
1. Heteropolymer problem	187
2. The yield catastrophe	189
3. Colloidal assembly	191
Lecture 4. Nucleation theory and multifarious assembly mixtures	195
1. Nucleation theory	195
2. Magic soup	196
Bibliography	199
P. Palffy-Muhoray, M. Pevnyi, E. Virga, and X. Zheng The Effects of Particle Shape in Orientationally Ordered Soft Materials	201
Introduction	203
Lecture 1. Soft condensed matter and orientational order	205
1. Soft condensed matter	205
2. Position and orientation	206
3. Orientational order parameters	210
Lecture 2. The free energy	213
1. Helmholtz free energy	214
2. Trial free energy	215
3. Configurational partition function	215
4. Pairwise interactions	215
5. Soft and hard potentials	216
6. Mean-field free energy	217
7. Density functional theory	219
Lecture 3. Particle shape and attractive interactions	227
1. Polarizability of a simple atom	228
2. Dispersion interaction	230
3. Polarizability of non-spherical particles	231
Lecture 4. Particle shape and repulsive interactions	239
1. Onsager theory	240
2. Excluded volume for ellipsoids	241
3. Phase separation	242
4. Minimum excluded volume of convex shapes	244
5. Systems of hard polyhedra	247

Summary	249
Bibliography	251
Roman Kotecký	
Statistical Mechanics and Nonlinear Elasticity	255
Introduction	257
Lecture 1. Statistical mechanics	259
Statistical mechanics of interacting particles	259
Lattice models of nonlinear elasticity	261
Ising model	263
Lecture 2. Phase transitions	267
Existence of the free energy	267
Concavity of the free energy	268
Peierls argument	269
Lecture 3. Expansions	275
The high temperature expansion	275
Intermezzo (cluster expansions)	277
Proof of cluster expansion theorem	280
Lecture 4. Gradient models of random surface	283
Quadratic potential	283
Convex potentials	285
Non-convex potentials	286
Lecture 5. Nonlinear elasticity	291
Free energy	291
Macroscopic behaviour from microscopic model	293
Main ingredients of the proof of quasiconvexity of W	294
Bibliography	297
Peter Bella, Arianna Giunti, and Felix Otto	
Quantitative Stochastic Homogenization: Local Control of Homogenization Error through Corrector	299
1. A brief overview of stochastic homogenization, and a common vision for quenched and thermal noise	301
2. Precise setting and motivation for this work	304
3. Main results	307
4. Proofs	309
Bibliography	326
