Preface	xi
0 Introduction and Review of Linear Algebra	1
0.1 General background and motivation	1
0.2 Some linear algebra notation and background	2
0.3 Fixed-point iterative methods for nonlinear systems	15
0.4 Fixed-point iterative methods for linear systems	16
I Vector Extrapolation Methods	29
1 Development of Polynomial Extrapolation Methods	31
1.1 Preliminaries	31
1.2 Solution to $x = Tx + d$ from $\{x_m\}$	35
1.3 Derivation of MPE, RRE, MMPE, and SVD-MPE	39
1.4 Finite termination property	45
1.5 Application of polynomial extrapolation methods to arbitrary $\{x_m\}$	47
1.6 Further developments	48
1.7 Determinant representations	49
1.8 Compact representations	55
1.9 Numerical stability in polynomial extrapolation	56
1.10 Solution of $x = f(x)$ by polynomial extrapolation methods in cycling mode	57
1.11 Final remarks	63
2 Unified Algorithms for MPE and RRE	65
2.1 General considerations	65
2.2 QR factorization	66
2.3 Solution of least-squares problems by QR factorization	67
2.4 Algorithms for MPE and RRE	71
2.5 Error estimation via algorithms	74
2.6 Further algorithms for MPE and RRE	78
3 MPE and RRE Are Related	83
3.1 Introduction	83
3.2 $R_k \gamma_k$ for MPE and RRE	85
3.3 First main result	86
3.4 Second main result	87
3.5 Peak-plateau phenomenon	88

4	Algorithms for MMPE and SVD-MPE	91
4.1	Introduction	91
4.2	LU factorization and SVD	92
4.3	Algorithm for MMPE	92
4.4	Error estimation via algorithm for MMPE	95
4.5	Algorithm for SVD-MPE	95
4.6	Error estimation via algorithm for SVD-MPE	98
5	Epsilon Algorithms	99
5.1	Introduction	99
5.2	SEA	99
5.3	VEA	106
5.4	TEA	110
5.5	Implementation of epsilon algorithms in cycling mode	114
5.6	ETEA: An economical implementation of TEA	115
5.7	Comparison of epsilon algorithms with polynomial methods	117
6	Convergence Study of Extrapolation Methods: Part I	119
6.1	Introduction	119
6.2	Convergence and stability of rows in the extrapolation table	121
6.3	Technical preliminaries	128
6.4	Proof of Theorem 6.6 for MMPE and TEA	130
6.5	Proof of Theorem 6.6 for MPE and RRE	137
6.6	Another proof of (6.13)	145
6.7	Proof of Theorem 6.7	145
6.8	Generalizations	148
6.9	Extension to infinite-dimensional spaces	153
7	Convergence Study of Extrapolation Methods: Part II	155
7.1	Introduction	155
7.2	Simple error bounds for $s_{n,k}^{RRE}$	156
7.3	Error bounds for $s_{n,k}^{MPE}$ and $s_{n,k}^{RRE}$ via orthogonal polynomials	158
7.4	Appraisal of the upper bounds on $\Gamma_{n,k}^D$ and conclusions	170
7.5	Justification of cycling	173
7.6	Cycling and nonlinear systems of equations	174
8	Recursion Relations for Vector Extrapolation Methods	177
8.1	Introduction	177
8.2	Recursions for fixed m	179
8.3	Recursions for $m = n + q$ with fixed q	181
8.4	Recursions for fixed n	183
8.5	qd-type algorithms and the matrix eigenvalue problem	184
II	Krylov Subspace Methods	189
9	Krylov Subspace Methods for Linear Systems	191
9.1	Projection methods for linear systems	191
9.2	Krylov subspace methods: General discussion	197
9.3	Method of Arnoldi: Full orthogonalization method (FOM)	203

9.4	Method of generalized minimal residuals (GMR)	206
9.5	FOM and GMR are related	208
9.6	Recursive algorithms for FOM and GMR with A Hermitian positive definite: A unified treatment of conjugate gradients and conjugate residuals	209
9.7	On the existence of short recurrences for FOM and GMR	219
9.8	The method of Lanczos	220
9.9	Preconditioning	226
9.10	FOM and GMR with prior iterations	229
9.11	Krylov subspace methods for nonlinear systems	230
10	Krylov Subspace Methods for Eigenvalue Problems	233
10.1	Projection methods for eigenvalue problems	233
10.2	Krylov subspace methods	235
10.3	The method of Arnoldi	239
10.4	The method of Lanczos	245
10.5	The case of Hermitian A	247
10.6	Methods of Arnoldi and Lanczos for eigenvalues with special properties	250
III	Applications and Generalizations	261
11	Miscellaneous Applications of Vector Extrapolation Methods	263
11.1	Introduction	263
11.2	Computation of steady-state solutions	263
11.3	Computation of eigenvectors with known eigenvalues	266
11.4	Computation of eigenpair derivatives	273
11.5	Application to solution of singular linear systems	277
11.6	Application to multidimensional scaling	279
12	Rational Approximations from Vector-Valued Power Series: Part I	285
12.1	Introduction	285
12.2	Derivation of vector-valued rational approximations	286
12.3	A compact formula for $\mathbf{s}_{n,k}(z)$ from SMPE	289
12.4	Algebraic properties of $\mathbf{s}_{n,k}(z)$	290
12.5	Efficient computation of $\mathbf{s}_{n,k}(z)$ from SMPE	294
12.6	Some sources of vector-valued power series	296
12.7	Convergence study of $\mathbf{s}_{n,k}(z)$: A constructive theory of de Montessus type	297
13	Rational Approximations from Vector-Valued Power Series: Part II	305
13.1	Introduction	305
13.2	Generalized inverse vector-valued Padé approximants	305
13.3	Simultaneous Padé approximants	308
13.4	Directed simultaneous Padé approximants	310
14	Applications of SMPE, SMMPE, and STEA	313
14.1	Introduction	313
14.2	Application to the solution of $\mathbf{x} = z\mathbf{A}\mathbf{x} + \mathbf{b}$ versus Krylov subspace methods	313

14.3	A related application to Fredholm integral equations	316
14.4	Application to reanalysis of structures	317
14.5	Application to nonlinear differential equations	318
14.6	Application to computation of $f(A)b$	320
15	Vector Generalizations of Scalar Extrapolation Methods	327
15.1	Introduction	327
15.2	Review of a generalized Richardson extrapolation process	327
15.3	Vectorization of FGREP	329
15.4	A convergence theory for FGREP2	332
15.5	Vector extrapolation methods from scalar sequence transformations	341
16	Vector-Valued Rational Interpolation Methods	345
16.1	Introduction	345
16.2	Development of vector-valued rational interpolation methods	345
16.3	Algebraic properties of interpolants	351
16.4	Convergence study of $r_{p,k}(z)$: A constructive theory of de Montessus type	354
IV	Appendices	359
A	QR Factorization	361
A.1	Gram–Schmidt orthogonalization (GS) and QR factorization	361
A.2	Modified Gram–Schmidt orthogonalization (MGS)	364
A.3	MGS with reorthogonalization	365
B	Singular Value Decomposition (SVD)	367
B.1	Full SVD	367
B.2	Reduced SVD	369
B.3	SVD as a sum of rank-one matrices	370
C	Moore–Penrose Generalized Inverse	373
C.1	Definition of the Moore–Penrose generalized inverse	373
C.2	SVD representation of A^+	374
C.3	Connection with linear least-squares problems	374
C.4	Moore–Penrose inverse of a normal matrix	374
D	Basics of Orthogonal Polynomials	377
D.1	Definition and basic properties of orthogonal polynomials	377
D.2	Some bounds related to orthogonal polynomials	378
E	Chebyshev Polynomials: Basic Properties	381
E.1	Definition of Chebyshev polynomials	381
E.2	Zeros, extrema, and min-max properties	382
E.3	Orthogonality properties	383
F	Useful Formulas and Results for Jacobi Polynomials	385
F.1	Definition of Jacobi polynomials	385
F.2	Some consequences	385

G	Rayleigh Quotient and Power Method	387
G.1	Properties of the Rayleigh quotient	387
G.2	The power method	389
G.3	Inverse power method or inverse iteration	391
G.4	Inverse power method with variable shifts	392
H	Unified FORTRAN 77 Code for MPE and RRE	397
	Bibliography	405
	Index	427
