Preface	xiii
List of Symbols	xix
List of Abbreviations	xxi
I Stability analysis of linear time-delay systems	1
1 Spectral properties of linear time-delay systems	3
1.1 Time-delay systems of retarded type	4
1.1.1 The initial value problem	4
1.1.2 Spectrum: definitions	7
1.1.3 Asymptotic growth rate of solutions and stability	8
1.1.4 Spectrum: qualitative properties	9
1.1.5 Spectrum: continuity properties	11
1.1.6 Computation of characteristic roots	13
1.2 Time-delay systems of neutral type	15
1.2.1 The initial value problem	15
1.2.2 Spectrum: definitions	16
1.2.3 Asymptotic growth rate of solutions and stability	19
1.2.4 Spectrum: qualitative properties	20
1.2.5 Spectrum: continuity properties	22
1.2.6 Computation of characteristic roots	30
1.3 Notes and references	31
2 Pseudospectra and robust stability analysis	33
2.1 Introduction	33
2.2 Pseudospectra for nonlinear eigenvalue problems	35
2.2.1 Definition and expressions	35
2.2.2 Connection with stability radii	37
2.2.3 Computational issues	38
2.2.4 Application to time-delay systems	39
2.3 Structured pseudospectra for nonlinear eigenvalue problems	43

2.3.1	Motivation	43
2.3.2	Definition and expressions	43
2.3.3	Computational issues and special cases	46
2.3.4	Application to time-delay systems	49
2.4	Illustrative examples	49
2.4.1	Second-order system	50
2.4.2	Feedback controlled semi-conductor laser	52
2.5	Notes and references	53
3	Computation of stability regions in parameter spaces	57
3.1	Introduction	57
3.2	Basic notions and definitions	58
3.3	From D-subdivision to numerical continuation	59
3.3.1	D-subdivision and stability crossing boundaries	59
3.3.2	τ -decomposition and delay stability intervals	64
3.3.3	Numerical continuation	69
3.4	Computing the crossing direction of characteristic roots	71
3.4.1	Simple crossing characteristic roots	71
3.4.2	Semi-simple characteristic roots	75
3.4.3	Further analysis: basic ideas	78
3.4.4	Delay interdependence and crossing direction evaluation	80
3.5	Notes and references	81
4	Stability regions in delay-parameter spaces	85
4.1	Introduction	85
4.2	Invariance properties	86
4.2.1	Delay shifts and characteristic roots	86
4.2.2	Crossing direction invariance	87
4.3	Algebraic methods	88
4.3.1	Elimination principle: basic ideas	88
4.3.2	Matrix pencil approach and crossing characterization	90
4.3.3	Particular cases and other elimination techniques	94
4.4	Geometric methods	98
4.4.1	Identification of crossing points	99
4.4.2	Stability crossing curves	102
4.4.3	Tangents, smoothness and crossing direction	107
4.5	Notes and references	110
5	Delays ratio sensitivity and interference	113
5.1	Introduction	113
5.2	Preliminary results	115
5.2.1	Definitions and assumptions	115
5.2.2	Introductory example	116
5.3	Properties of some associated matrix-valued functions	118
5.4	Delay-independent stability and delay-interference phenomena	121
5.4.1	Delay-independent stability characterization	121

5.4.2	Delay-interference characterization	121
5.5	Illustrative examples	124
5.5.1	Interference in parameterized scalar delay systems	125
5.5.2	Delay rays and second-order delay systems	125
5.6	Notes and references	129
6	Stability of linear periodic systems with delays	133
6.1	Introduction	133
6.2	Systems with fast varying coefficients	134
6.2.1	Averaging periodic systems	134
6.2.2	Computational tools	137
6.2.3	Analytical tools	137
6.3	General case	139
6.3.1	Collocation scheme	139
6.3.2	Computation of stability determining eigenvalues	140
6.3.3	Computation of stability regions	141
6.3.4	Special cases	142
6.3.5	Comparison with the averaging based approach	143
6.4	Illustrative examples	143
6.4.1	Variable spindle speed cutting machine	143
6.4.2	Forced elastic column	144
6.5	Notes and references	147
II	Stabilization and robust stabilization	149
7	The continuous pole placement method	151
7.1	Introduction	151
7.2	Motivation	152
7.2.1	A finite-dimensional controller for an infinite-dimensional problem	152
7.2.2	Methods based on prediction	155
7.2.3	Scalar example	156
7.3	Continuous pole placement algorithm	157
7.3.1	Description of the algorithm	157
7.3.2	Theoretical properties	161
7.3.3	Optimization point of view	162
7.4	Illustrative examples	164
7.4.1	Model problem	164
7.4.2	General stabilization problems	166
7.5	Extensions of state feedback	170
7.5.1	Multiple input, multiple output systems	170
7.5.2	Observer based controllers	173
7.5.3	Finite-dimensional dynamic state feedback	175
7.6	Systems of neutral type	175
7.6.1	Algorithm	176

7.6.2	Illustrative example	177
7.7	Notes and references	177
8	Stabilizability with delayed feedback: a numerical case-study	181
8.1	Introduction	181
8.2	Characterization of stabilizable systems	182
8.2.1	System representation	182
8.2.2	Class of stabilizable systems for the unit delay	183
8.2.3	Class of stabilizable system for arbitrary delay values	190
8.2.4	Discussion	191
8.2.5	Non-cyclic system matrix	192
8.3	Simultaneous stabilization over a delay interval	192
8.4	Notes and references	194
9	The robust stabilization problem	197
9.1	Introduction	197
9.2	Stability radii as robustness measures	198
9.3	Motivating examples	199
9.4	Robust stabilization procedure	200
9.4.1	Continuity properties	200
9.4.2	Algorithm	202
9.5	Illustrative example	205
9.6	Notes and references	207
10	Stabilization using a direct eigenvalue optimization approach	209
10.1	Introduction	209
10.2	Eigenvalue optimization approach	210
10.2.1	Smoothness properties of spectral abscissa function	210
10.2.2	The gradient sampling algorithm	211
10.2.3	Application to linear time-delay systems	215
10.2.4	Extension to nonlinear time-delay systems	216
10.3	Illustrative examples	216
10.3.1	Model problem	217
10.3.2	Semi-conductor laser	217
10.4	Notes and references	220
III	Applications	221
11	Output feedback stabilization: the single delay case	223
11.1	Introduction	223
11.2	Motivation: characterization of all stabilizable second-order systems	224
11.3	Necessary conditions for stabilizability	229
11.4	Controller construction	231
11.4.1	Prerequisites	231
11.4.2	Stabilization using the delay parameter	233

11.4.3	Stabilization using the delay and gain parameter	237
11.5	Geometry of stability regions	238
11.5.1	Identification of crossing points	239
11.5.2	Classification of stability crossing curves, smoothness and crossing directions	241
11.6	Illustrative examples	244
11.6.1	Second-order system	244
11.6.2	Sixth-order system	246
11.7	Notes and references	248
12	Output feedback stabilization: the multiple delay case	251
12.1	Introduction	251
12.2	Necessary conditions for stabilizability	252
12.3	Stabilization of multiple integrators	253
12.3.1	Control laws based on numerical differentiation with back- wards differences	253
12.3.2	Control laws based on exact pole placement and low-gain design	256
12.4	Illustrative example	259
12.5	Notes and references	259
13	Congestion control algorithms in networks	261
13.1	Algorithms for single connection models with two delays	262
13.1.1	Model and related remarks	262
13.1.2	Linear stability analysis	264
13.1.3	Interpretations and discussions	267
13.2	TCP/AQM congestion avoidance models with one delay	270
13.2.1	Model and related remarks	270
13.2.2	Transformation	271
13.2.3	Stability analysis	272
13.3	Notes and references	277
14	Smith predictor for stable systems: delay sensitivity analysis	279
14.1	Introduction	279
14.2	Sensitivity of stability w.r.t. infinitesimal delay mismatches	281
14.2.1	Instability mechanism	282
14.2.2	Conditions for practical stability	283
14.3	Stability analysis and critical delay mismatches	286
14.4	Geometry of stability regions	288
14.4.1	Identification of crossing points	288
14.4.2	Stability crossing curves: smoothness, and crossing di- rections	290
14.5	Illustrative example	290
14.6	Multivariable case	292
14.6.1	Practical stability condition	292
14.6.2	Stability domain	293

14.7	Notes and references	296
15	Controlling unstable systems using finite spectrum assignment	297
15.1	Introduction	297
15.2	Preliminaries	298
15.3	Implementation of the integral	300
15.3.1	Instability mechanism	300
15.3.2	Stability conditions	301
15.3.3	Removing restrictions	305
15.4	Delay mismatch	308
15.5	Output feedback	308
15.5.1	Static output feedback	309
15.5.2	Dynamic output feedback and relations with Smith predictors	309
15.6	Notes and references	311
16	Consensus problems in traffic flow applications	313
16.1	Introduction	313
16.2	Extension of stability theory to systems with distributed delays	316
16.3	Conditions for the realization of a consensus	320
16.3.1	Prerequisites	320
16.3.2	Computation of stability regions	321
16.4	Examples	324
16.5	Other models	326
16.6	Notes and references	328
17	Stability analysis of delay models in biosciences	329
17.1	Introduction	329
17.2	Delay effects on stability in some human respiration models	330
17.2.1	Delay model and its linearization	330
17.2.2	Stability analysis and delay intervals	331
17.2.3	Discussions and interpretations	334
17.3	Delays in immune dynamics models in leukemia	335
17.3.1	Delay model and its linearization	335
17.3.2	Stability analysis in the delay-parameter space	336
17.3.3	Illustrative example and discussions	342
17.4	Notes and references	346
A	Appendices	349
A.1	Rouché's theorem	349
A.2	The structured singular value	349
A.3	Continuity properties	351
A.4	Interdependency of numbers	351
A.5	Software	352
	Bibliography	355
