Preface	xi
1 Existence of Lagrange Multipliers	1
1.1 Problem statement and generalities	1
1.2 A generalized open mapping theorem	3
1.3 Regularity and existence of Lagrange multipliers	5
1.4 Applications	8
1.5 Weakly singular problems	17
1.6 Approximation, penalty, and adapted penalty techniques	23
1.6.1 Approximation techniques	23
1.6.2 Penalty techniques	24
2 Sensitivity Analysis	27
2.1 Generalities	27
2.2 Implicit function theorem	31
2.3 Stability results	34
2.4 Lipschitz continuity	45
2.5 Differentiability	53
2.6 Application to optimal control of an ordinary differential equation	62
3 First Order Augmented Lagrangians for Equality and Finite Rank Inequality Constraints	65
3.1 Generalities	65
3.2 Augmentability and sufficient optimality	67
3.3 The first order augmented Lagrangian algorithm	75
3.4 Convergence of Algorithm ALM	78
3.5 Application to a parameter estimation problem	82
4 Augmented Lagrangian Methods for Nonsmooth, Convex Optimization	87
4.1 Introduction	87
4.2 Convex analysis	89
4.2.1 Conjugate and biconjugate functionals	92
4.2.2 Subdifferential	95
4.3 Fenchel duality theory	98

4.4	Generalized Yosida–Moreau approximation	104
4.5	Optimality systems	109
4.6	Augmented Lagrangian method	114
4.7	Applications	119
4.7.1	Bingham flow	120
4.7.2	Image restoration	121
4.7.3	Elastoplastic problem	122
4.7.4	Obstacle problem	122
4.7.5	Signorini problem	124
4.7.6	Friction problem	125
4.7.7	L^1 -fitting	126
4.7.8	Control problem	126
5	Newton and SQP Methods	129
5.1	Preliminaries	129
5.2	Newton method	133
5.3	SQP and reduced SQP methods	137
5.4	Optimal control of the Navier–Stokes equations	143
5.4.1	Necessary optimality condition	145
5.4.2	Sufficient optimality condition	147
5.4.3	Newton’s method for (5.4.1)	147
5.5	Newton method for the weakly singular case	148
6	Augmented Lagrangian-SQP Methods	155
6.1	Generalities	155
6.2	Equality-constrained problems	156
6.3	Partial elimination of constraints	165
6.4	Applications	172
6.4.1	An introductory example	172
6.4.2	A class of nonlinear elliptic optimal control problems	174
6.5	Approximation and mesh-independence	183
6.6	Comments	186
7	The Primal-Dual Active Set Method	189
7.1	Introduction and basic properties	189
7.2	Monotone class	196
7.3	Cone sum preserving class	197
7.4	Diagonally dominated class	200
7.5	Bilateral constraints, diagonally dominated class	202
7.6	Nonlinear control problems with bilateral constraints	206
8	Semismooth Newton Methods I	215
8.1	Introduction	215
8.2	Semismooth functions in finite dimensions	217
8.2.1	Basic concepts and the semismooth Newton algorithm	217
8.2.2	Globalization	222

Contents	ix
<hr/>	
8.2.3 Descent directions	225
8.2.4 A Gauss–Newton algorithm	228
8.2.5 A nonlinear complementarity problem	231
8.3 Semismooth functions in infinite-dimensional spaces	234
8.4 The primal-dual active set method as a semismooth Newton method	240
8.5 Semismooth Newton methods for a class of nonlinear complementarity problems	243
8.6 Semismooth Newton methods and regularization	246
9 Semismooth Newton Methods II: Applications	253
9.1 BV-based image restoration problems	254
9.2 Friction and contact problems in elasticity	263
9.2.1 Generalities	263
9.2.2 Contact problem with Tresca friction	265
9.2.3 Contact problem with Coulomb friction	272
10 Parabolic Variational Inequalities	277
10.1 Strong solutions	281
10.2 Regularity	291
10.3 Continuity of $q \rightarrow y(q) \in L^\infty(\Omega)$	292
10.4 Difference schemes and weak solutions	297
10.5 Monotone property	302
11 Shape Optimization	305
11.1 Problem statement and generalities	305
11.2 Shape derivative	308
11.3 Examples	314
11.3.1 Elliptic Dirichlet boundary value problem	314
11.3.2 Inverse interface problem	316
11.3.3 Elliptic systems	321
11.3.4 Navier–Stokes system	323
Bibliography	327
Index	339
