Partial Differential Equations: Analytical and Numerical Methods, Second Edition

Mark S. Gockenbach

Partial differential equations are essential for modeling many physical phenomena. This undergraduate textbook introduces students to the topic with a unique approach that emphasizes the modern finite element method alongside the classical method of Fourier analysis. Additional features of this new edition include broader coverage of PDE methods and applications, with new chapters on the method of characteristics, Sturm–Liouville problems, and Green’s functions.

Shapes and Geometries: Metrics, Analysis, Differential Calculus, and Optimization, Second Edition

Michel C. Delfour and Jean-Paul Zolésio

This considerably enriched new edition provides a self-contained presentation of the mathematical foundations, constructions, and tools necessary for studying problems where the modeling, optimization, or control variable is the shape or the structure of a geometric object. This book presents the latest ground-breaking theoretical foundation to shape optimization in a form that can be used by the engineering and scientific communities.

The Linear Sampling Method in Inverse Electromagnetic Scattering

Fioralba Cakoni, David Colton, and Peter Monk

The linear sampling method is the oldest and most developed of the qualitative methods in inverse scattering theory. It is based on solving a linear integral equation and then using the equation’s solution as an indicator function for the determination of the support of the scattering object. This book describes the linear sampling method for a variety of electromagnetic scattering problems.

Generalized Concavity

Mordecai Avriel, Walter E. Diewert, Siegfried Schaible, and Israel Zang

Originally published in 1988, this enduring text remains the most comprehensive book on generalized convexity and concavity. The authors present generalized concave functions in a unified framework, exploring them primarily from the domains of optimization and economics. Specific topics covered in this book include a review of concavity and the basics of generalized concavity; applications of generalized concavity to economics; and special function forms.

Nonlinear Programming: Concepts, Algorithms, and Applications to Chemical Processes

Lorenz T. Biegler

This book addresses modern nonlinear programming (NLP) concepts and algorithms, especially as they apply to challenging applications in chemical process engineering. The author provides a firm grounding in fundamental NLP properties and algorithms, and relates them to real-world problem classes in process optimization, thus making the material understandable and useful to chemical engineers and experts in mathematical optimization.

Modeling, Simulation, and Optimization of Supply Chains: A Continuous Approach

Ciro D'Apice, Simone Göttlich, Michael Herty, and Benedetto Piccoli

This book offers a state-of-the-art introduction to the mathematical theory of supply chain networks, focusing on supply chain networks described by partial differential equations (PDEs). The authors discuss modeling of complex supply networks as well as their mathematical theory; explore modeling, simulation, and optimization of some of the discussed models; and present analytical and numerical results on optimization problems. Real-world examples are given to demonstrate the applicability of the presented approaches.

Introduction to the Mathematics of Subdivision Surfaces

Lars-Erik Andersson and Neil F. Stewart

This book provides a careful and rigorous presentation of the mathematics underlying subdivision surfaces as used in computer graphics and animation, explaining the concepts necessary to easily read the subdivision literature. It also organizes subdivision methods in a unique and unambiguous hierarchy in order to provide insight and understanding. The material is not restricted to questions related to regularity of subdivision surfaces at so-called extraordinary points but instead gives a broad discussion of the various methods.

\mathcal{L}_1 Adaptive Control Theory: Guaranteed Robustness with Fast Adaptation

Naira Hovakimyan and Chengyu Cao

This book presents a comprehensive overview of the recently developed \mathcal{L}_1 adaptive control theory, including detailed proofs of the main results. The key feature of the \mathcal{L}_1 adaptive control theory is the decoupling of adaptation from robustness. The architectures of \mathcal{L}_1 adaptive control theory have guaranteed transient performance and robustness in the presence of fast adaptation, without enforcing persistent excitation, applying gain-scheduling, or resorting to high-gain feedback. The book contains results not yet published in technical journals and conference proceedings.

Primer on Optimal Control Theory

Jason L. Speyer and David H. Jacobson

The performance of a process—for example, how an aircraft consumes fuel—can be enhanced when the most effective controls and operating points for the process are determined. This holds true for many physical, economic, biomedical, manufacturing, and engineering processes whose behavior can often be influenced by altering certain parameters or controls to optimize some desired property or output. This book provides a rigorous introduction to analyzing these processes and finding the best modes of control and operation for them. It makes optimal control theory accessible to a large class of engineers and scientists who are not mathematicians but have a basic mathematical background.

Discrete Inverse Problems: *Insight and Algorithms*

Per Christian Hansen

This book gives an introduction to the practical treatment of inverse problems by means of numerical methods, with a focus on basic mathematical and computational aspects. To solve inverse problems, the authors demonstrate that insight about them goes hand in hand with algorithms. Written for graduate students, researchers, and professionals in engineering and other areas that depend on solving inverse problems with noisy data, the book aims to provide readers with enough background that they can solve simple inverse problems and read more advanced literature on the subject.

Nonlinear Waves in Integrable and Nonintegrable Systems

Jianke Yang

This groundbreaking new book presents cutting-edge developments in the theory and experiments of nonlinear waves. Its comprehensive coverage of analytical and numerical methods for nonintegrable systems is the first of its kind. It is intended for researchers and graduate students working in applied mathematics and various physical subjects where nonlinear wave phenomena arise.

Normal Approximation and Asymptotic Expansions

Rabi N. Bhattacharya and R. Ranga Rao

Although first published in 1976, this book has gained new significance and renewed interest among statisticians due to the developments of modern statistical techniques such as the bootstrap, the efficacy of which can be ascertained by asymptotic expansions. This also is the only book containing a detailed treatment of various refinements of the multivariate central limit theorem (CLT); this edition of the book includes a new chapter that provides an application of Stein's method of approximation to the multivariate CLT.
