Preface	xi
I Concepts and Properties of Real-Time, Online Strategies	1
1 Constrained Optimal Feedback Control for DAE	3
1.1 Introduction	3
1.1.1 Differential Algebraic Equation Systems	4
1.1.2 Nonlinear Model Predictive Control	4
1.1.3 Overview	5
1.2 Direct Multiple Shooting for DAE	6
1.2.1 Parametrization of the Infinite Optimization Problem	6
1.2.2 Structured Nonlinear Programming Problem	7
1.2.3 Structure of the NLP	8
1.2.4 A Newton-type Method Solution Framework	8
1.3 Initial Value Embedding and Real-Time Iterations	9
1.3.1 Standard Real-Time Iteration Scheme	10
1.3.2 Nominal Stability of the Real-Time Iteration Scheme	10
1.4 Real-Time Iteration Variants with Inexact Jacobians	11
1.4.1 Offline Condensing	11
1.4.2 Variant 1: Linear MPC based on a reference trajectory	12
1.4.3 Variant 2: Online feasibility improvement	13
1.4.4 Variant 3: Feasibility improvement for least squares problems	14
1.4.5 Variant 4: Online optimality improvement	14
1.4.6 Multi Level Real-Time Iteration Algorithms	15
1.5 Convergence analysis	17
1.5.1 Stability of the active set near a solution	18
1.5.2 Convergence for a given active set	18
1.6 Conclusions	20
Bibliography	21
2 A Stabilizing Real-Time Implementation of NMPC	25
2.1 Introduction	25

2.2	Discrete Time Nonlinear Model Predictive Control	26
2.2.1	Online Solution of NMPC: Interconnection of System and Optimizer Dynamics	29
2.3	The Real-Time Iteration Scheme	31
2.3.1	Review of Newton Type Iterations	31
2.3.2	The Real-Time Iteration Algorithm	32
2.4	Local Convergence of Newton Type Optimization	33
2.4.1	Local Convergence of Newton Type Methods for NMPC	34
2.5	Contractivity of the Real-Time Iterations	35
2.6	Stability of the Real-Time Iteration Scheme	38
2.6.1	Bounding the Error of Feedback Approximations	38
2.6.2	Combining Error Bound and Contractivity	39
2.6.3	Phase 1: Increase in Objective, but Decrease in Stepsize	39
2.6.4	Phase 2: Convergence towards the Origin	40
2.6.5	Nominal Stability of Real-Time Iterations Without Shift	42
2.7	Numerical Experiments: Distillation Control	43
2.7.1	Optimal Control Problem Formulation	44
2.7.2	Simulation Results and Discussion	45
2.8	Summary and Conclusions	46
	Bibliography	48
3	Numerical feedback controller design for PDE systems using model reduction: Techniques and case studies	53
3.1	Introduction	53
3.2	Proper orthogonal decomposition (POD)	54
3.3	Numerical design of SOF control laws	57
3.4	Numerical experiments	61
3.4.1	Example (Linear convection–diffusion model)	61
3.4.2	Example (Nonlinear unstable heat equation)	64
3.4.3	Example (Modified Burgers’ equation)	66
3.5	Conclusions	68
	Bibliography	68
4	Least-squares methods for optimization	73
4.1	Introduction	73
4.2	Quadratic optimization and control problems in Hilbert spaces with linear constraints	74
4.3	Least-squares formulation of the constraint equations	76
4.4	Methods based on constraining by the least-squares functional	80
4.4.1	Discretize-then-eliminate	82
4.4.2	Eliminate-then-discretize	83
4.5	Example: Optimization problems for the Stokes system	84
4.5.1	Precise statement of optimization problems	84
4.5.2	Least-squares formulation of the constraint equations	87
4.5.3	Discrete systems for the Stokes control problem	88
4.5.4	Some practical issues arising in implementations	90

4.6	Conclusions	92
	Bibliography	92
II	Fast PDE-Constrained Optimization Solvers	95
5	Space-time multigrid methods for solving unsteady optimal control problems	97
5.1	Introduction	97
5.2	Reaction diffusion optimal control problems and their approximation .	98
5.2.1	Finite differences discretization	99
5.3	The FAS multigrid framework	100
5.3.1	Space-time smoothing schemes	102
5.3.2	Receding horizon approach	105
5.4	Fourier smoothing analysis	106
5.5	Numerical experiments	107
5.6	An application in physiology	110
	Bibliography	111
6	A Time-Parallel Implicit Methodology for the Near-Real-Time Solution of Systems of Linear Oscillators	115
6.1	Introduction	115
6.2	Two frameworks for time-parallel algorithms	118
6.2.1	Notation and definitions	118
6.2.2	The parareal framework	120
6.2.3	The PITA framework	120
6.2.4	Equivalence for linear problems	121
6.3	Unstable behavior for linear oscillators	122
6.4	A new time-parallel framework for second-order hyperbolic problems .	124
6.4.1	Propagation of the jumps on both time-grids	124
6.4.2	Construction of the subspace \mathcal{S}_k	125
6.4.3	Construction of the projector P_k	126
6.4.4	Computational remarks	127
6.4.5	PITA for systems of linear oscillators	128
6.5	Mathematical analysis	129
6.5.1	Preliminaries	129
6.5.2	Error analysis of the hybrid coarse/fine propagation . . .	129
6.5.3	Convergence in a subspace	130
6.6	Examples	131
6.6.1	Free-vibration of a three-dimensional space structure . . .	132
6.6.2	Dynamic responses of an F-16 fighter aircraft	134
6.7	Summary and conclusions	136
	Bibliography	142
7	Generalized SQP-Methods with "Parareal" Time-Domain Decomposition for Time-dependent PDE-constrained Optimization	145
7.1	Introduction	145

7.2	Parareal time-domain decomposition	146
7.2.1	Description of the parareal method	146
7.2.2	Convergence properties of the parareal algorithm	148
7.2.3	Interpretation as preconditioned iteration	149
7.3	Time-domain decomposition of the optimal control problem	150
7.3.1	Optimality conditions	151
7.3.2	Structure of the adjoint equation	152
7.4	A generalized SQP-method	152
7.4.1	Basic assumptions	153
7.4.2	Review of classical trust-region SQP-methods	153
7.4.3	Development of the generalized SQP-algorithm	154
7.4.4	Convergence result	158
7.5	Application of the generalized SQP-method with parareal solvers	162
7.5.1	An optimal control problem for a semilinear parabolic equation	163
7.5.2	Propagators in the parareal scheme	163
7.5.3	Implementation of the generalized SQP-method	164
7.5.4	Numerical results	164
7.6	Conclusions	166
	Bibliography	167
8	Simultaneous Pseudo-Timestepping for State Constrained Optimization Problems in Aerodynamics	169
8.1	Introduction	169
8.2	Simultaneous pseudo-timestepping for optimization problems	170
8.3	Back Projection	173
8.4	Numerical results and discussion	175
8.5	Conclusions	179
	Bibliography	180
9	The Effect of the Digital Filter Stepsize Control on Control Optimization Performance	183
9.1	Introduction	183
9.2	The DAE Solver DASPK	184
9.3	Stepsize Controller	185
9.3.1	Original DASPK approach	185
9.3.2	Digital filter stepsize controller	186
9.4	The Optimization Solver KNITRO	187
9.5	Heat Shock Model	188
9.5.1	Pareto optimality	189
9.5.2	Multiobjective optimization formulation for heat shock	190
9.6	Numerical Efficiency Comparison	191
9.7	Conclusion	192
	Bibliography	192

III	Reduced Order Modeling	195
10	Certified Rapid Solution of Partial Differential Equations for Real-Time Parameter Estimation and Optimization	197
10.1	Introduction	197
10.2	Abstract Statement: Elliptic Linear Equations	198
10.3	Reduced-Basis Approximation	199
10.4	A Posteriori Error Estimation	199
10.5	Assess-Act Example: Helmholtz-Elasticity	202
10.6	Incompressible Navier-Stokes Equations	205
10.7	Parabolic Equations	208
	Bibliography	212
11	WillcoxMOR	217
11.1	Introduction	217
11.1.1	Problem Statement	218
11.1.2	Projection Framework	219
11.2	Proper orthogonal decomposition	219
11.2.1	Time-Domain POD Basis	219
11.2.2	Frequency-Domain POD Basis	220
11.2.3	POD Reduced-Order Model	221
11.2.4	Balanced POD	221
11.3	Fourier Model Reduction	223
11.3.1	Fourier Series of Discrete Time Systems	223
11.3.2	Fourier Series of Continuous Time Systems	225
11.3.3	Reduced Model Construction	225
11.3.4	FMR Algorithm	226
11.4	Active Flow Control of a Supersonic Diffuser	227
11.5	Conclusion	230
	Bibliography	231
12	Feedback control of flow separation	233
12.1	Introduction	233
12.2	Distributed volume control problem	234
12.3	POD-based reduced-order model	236
12.3.1	Proper orthogonal decomposition	236
12.3.2	Reduced order model	238
12.3.3	Construction of shape functions	239
12.4	Feedback design for the reduced model	240
12.4.1	Discretization of DPE	240
12.4.2	Numerical methods	241
12.4.3	Retrieving optimal control	242
12.5	Numerical results from volume control	243
12.6	Feedback design for boundary control	245
	Bibliography	248

IV Applications	251
13 Shape and topological sensitivity	253
13.1 Introduction and Motivation	253
13.2 Model and its topological sensitivity	256
13.2.1 A simple model	256
13.2.2 Topological derivative	257
13.2.3 Phase-I algorithm for topology optimization	260
13.3 Shape sensitivity	261
13.3.1 Shape gradient and shape Hessian	261
13.3.2 Newton-type flow and descent properties	262
13.3.3 Phase-II algorithm for shape optimization	264
13.4 Numerical realization and results	265
13.4.1 Numerical realization	265
13.4.2 Numerical results	267
13.5 Conclusion	272
Bibliography	274
14 COFIR: Coarse and Fine Image Registration	277
14.1 Introduction	277
14.2 The mathematical setting	278
14.3 Discretization	280
14.4 Optimization scheme	280
14.4.1 Optimizing the coarse part	281
14.4.2 Optimizing the fine part	281
14.4.3 The multilevel approach	282
14.5 Numerical Example	283
14.6 Conclusions and further discussion	284
Bibliography	285
15 Real-time, Large Scale Optimization of Water Network Systems using a Sub-domain Approach	289
15.1 Introduction	289
15.1.1 Contamination Source Determination	290
15.1.2 Outline of chapter	291
15.2 Dynamic Optimization Formulation	291
15.2.1 Origin Tracking Algorithm	294
15.2.2 Network Subdomain Approach	297
15.3 Numerical Results	299
15.3.1 Results: Fixed Discretization, Variable Problem Size	300
15.3.2 Results: Fixed Problem Size, Variable Discretization	303
15.4 Conclusions and Future Work	304
Bibliography	306
Index	307
